Advanced Programming

Árpád Tamási · ELTE Faculty of Social Sciences

SESSION 8 — 10 NOVEMBER 2026

SESSION 8

Today

60 minutes active, 30 minutes consultation.

What’s left · Your page · Your video · Your demo day · Homework

What’s left

Two homeworks, then your demo

	WHAT	FOR
Page	a promo page on GitHub Pages	anyone who wants to know what it is, or try it
Video	about 30 seconds, on your page	someone who has never heard of it
Presentation	five slides, five minutes of talk	the room, on your demo day

Your page

Your page is a promo page

- **Its content:** what it is for, who it is for, and more. Made with gstack.
- **How to try it.** If your program runs online, a link to it.
- **Your video.**
- Later: **a link to your slides.**

Before you start

Say this to Claude once:

> After each step from now on, commit, and add a row to PROCESS.md: the step, what the tool did, and what I decided.

The content: gstack

Open gstack's `/office-hours` and say:

> **Help me write the content of my program's promo page.**

gstack makes the content of your page. Then Impeccable gives it its look.

Install Impeccable

Open Claude Code and say:

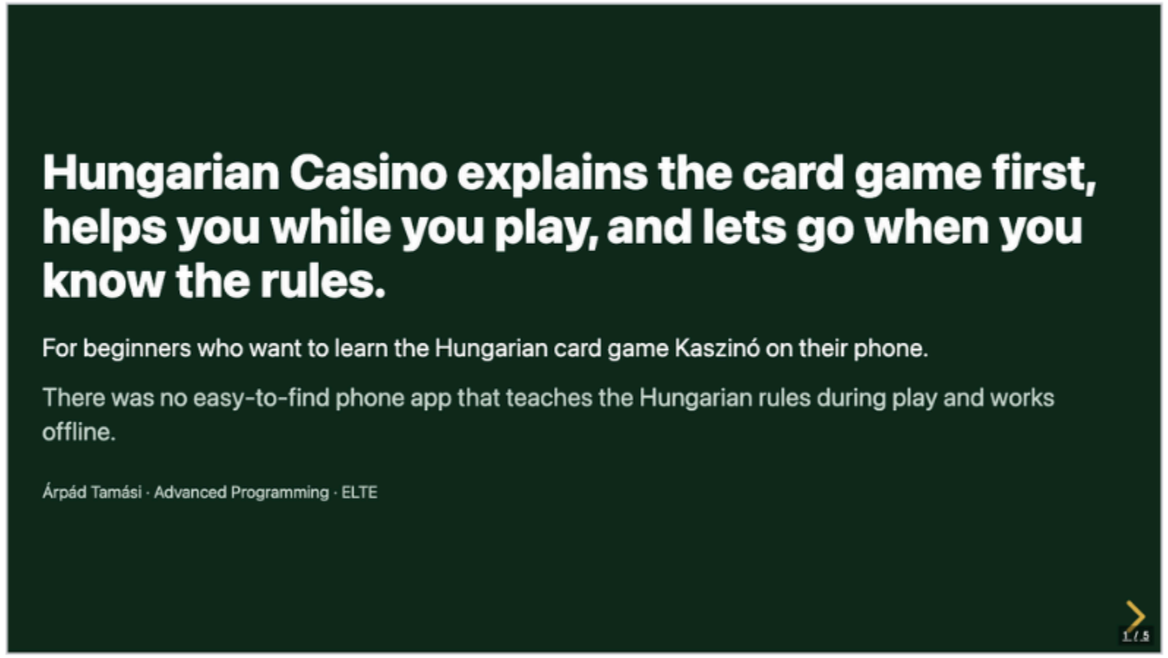

> Install Impeccable from impeccable.style.

impeccable.style, Install.

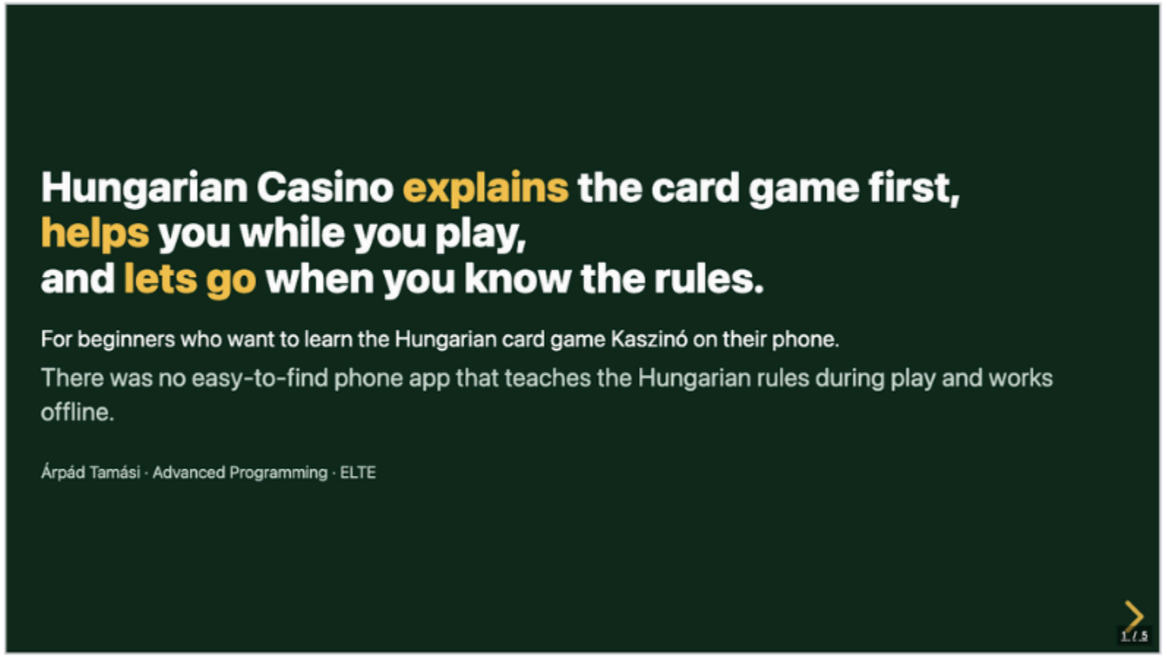

Impeccable, step by step

	STEP	WHAT IT DOES
1	`shape`	a design brief for your page; no code yet
2	`generate`	variants of your page in your browser; **you pick one**
3	`critique`	looks at your page as **a classmate, your teacher, and a stranger**; names its weakest part

shape and generate, on the Cassino

First version, built from the brief

After generate: variant 1 of 3

The words did not change. What changed: which three words you remember.

What will trip you up

- **Impeccable's detector refuses overused fonts** (Fraunces, Inter, Roboto …). Let it.
- `generate` **happens in your browser:** keep the page open, and pick there.

Before you publish

GitHub Pages publishes everything in the folder, to anyone, and the repository must be public.

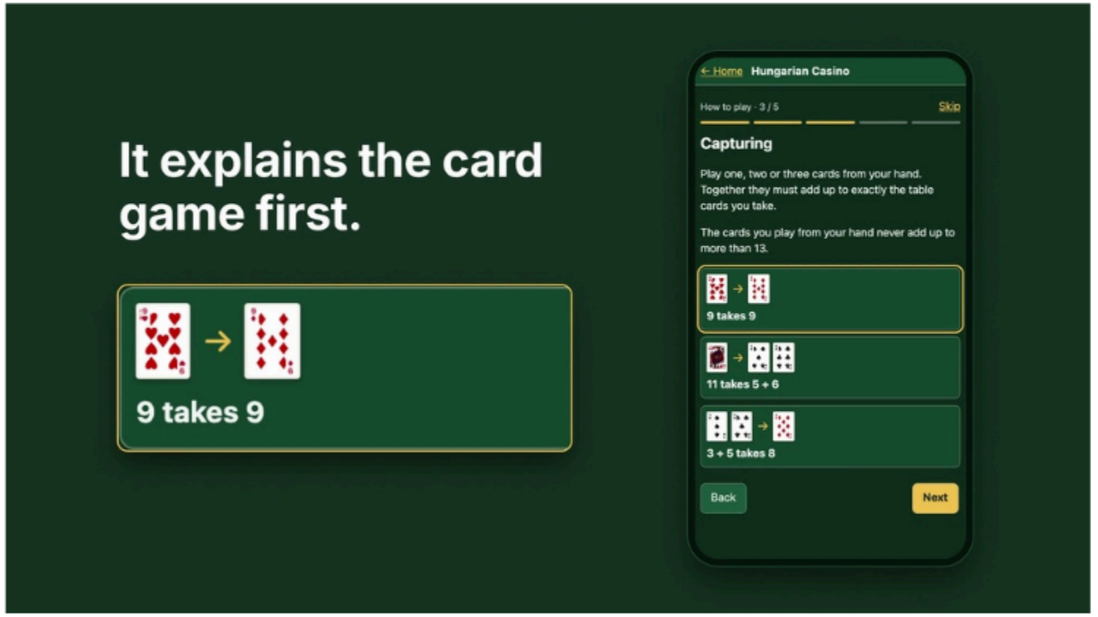

- No personal data: bank statements, photos of faces, real names.
- Deleting a file is not enough: it stays in the git history.
- If something got in, ask me. Rewriting history is possible, but it is a separate job.

GitHub Docs: “Removing sensitive data from a repository”.

Your video

30 seconds: your sentence, moving

- **Three beats,** one for each part of your sentence.
- **Real screens** from your program.
- **No sound** needed. One line of text at a time.
- It lives on your page, **not in your presentation**.

Making it

Open Claude Code and say:

> **Install HyperFrames from github.com/heygen-com/hyperframes. Then make a 30-second promo video from my promo page.**

It needs Node 22+ and FFmpeg. If it won't start: record your screen, and add captions.

github.com/heygen-com/hyperframes, README. Cassino video: hyperframes 0.9.26.

Your demo day

SESSION 8 YOUR DEMO DAY

1 and 8 December

Five minutes each. A presentation,
not a live run.

Everyone else in the room is your audience.

Come to both days.

"The second half of the semester", Canvas announcement,
18 October 2026.

Five minutes, five slides

	SLIDE
1	Who it is for, and why
2	Your demo: what goes in, what comes out — screenshots from a real run
3	Why it works: one check you did yourself — a test, a known answer, or a refusal
4	What you learned
5	What’s next: where you would take it from here

One minute per slide. No title slide: your name goes on the first one.

Slide 4: what you learned

CHOOSE ONE

- **A.** One moment the agent got it wrong, and how you noticed.
- **B.** One decision the agent could not make for you.
- **C.** What you would do differently in your next project.

MAKE IT CONCRETE

- One moment, from your own repository.
- A commit, a test, a log entry, a change request: something I can open.

The rules for your slides

- **Every screenshot from a real run** of your program. An illustration is labelled as one.
- **Every number has a source:** a run, a file, a test.
- **No speaker notes in the published deck:** on GitHub Pages anyone can read them in the page source.
- **It opens from one address.** We project from one shared computer, and I link every deck from esst-prog2.github.io.

Where your slides go

One address for everyone:

esst-prog2.github.io/your-repo/slides/

YOUR PAGE IS PUBLISHED	PUT YOUR SLIDES IN
from the `/docs` folder	`docs/slides/index.html`
from the root of `main`	`slides/index.html`
by a GitHub Actions build (Vite, …)	the folder it copies as it is, e.g. `public/slides/index.html`

reveal.js: slides are a web page

Open Claude Code and say:

> **Make my five slides with reveal.js, in one HTML file, in the slides folder of my GitHub Pages site, so that they open at esst-prog2.github.io/my-repo/slides/.**

When you present: → next · **S** speaker view · **O** overview · **F** full screen.

revealjs.com

Live: the Cassino deck

- Five slides at **esst-prog2.github.io/cassino/slides/**, the same pattern as yours.
- Slide 5: what's next.
- **O** for the overview, **S** for the speaker view.

Homework

Homework 9 — Your page

1. **The content:** work it out with gstack's `/office-hours`.
2. **The look, with Impeccable:** `shape`, `generate`, `critique` (as a classmate, your teacher, a stranger).
3. **On GitHub Pages:** a promo page. If your program runs online, a link to it.
4. **A `PROCESS.md`,** one commit per step.
5. Paste on Canvas: the address of your page.

Due **Saturday 14 November, 20:00**.

Homework 10 — Your video

1. **About 30 seconds,** made with HyperFrames, or a screen recording with captions.
2. **On your page.**
3. Paste on Canvas: the address of your page.

Due **Saturday 21 November, 20:00**.

The dates

14 November	your page
17 November	next class
21 November	your video
24 November	last class
28 November	your slides in your repository
1 and 8 December	the demos: come to both
